```

yum install gitlab-ce -y//安装

配置 gitlab:

vim /etc/gitlab/gitlab.rb//域名改为 IP

拉取项目

```
# git clone git@123.60.53.78:root/our_apps.git    #把仓库 clone 到客户端
# cd our_apps.git
# mv qqfarm .
# git add .
# git commit -m "V1"    #打标签 V1
```

```
# git config --global user.email "root@hecs-x-large-2-linux-20210914145605"
# git config --global user.name "root"
# git push -u origin main    #进行提交
```

拉取项目成功

2. jenkins

1. 安装 java 环境

```
[root@jenkins ~]# yum install lrzsz - // 安装 rz 命令
[root@jenkins ~]# rz 上传 jdk1.8 的压缩包
[root@jenkins ~]# tar xf jdk-8u211-linux-x64.tar.gz -C /usr/local
[root@jenkins local]# vim /etc/profile.d/java.sh
(写入以下内容)
#!/bin/bash
JAVA_HOME=/usr/local/java1.8
PATH=$JAVA_HOME/bin:$PATH
export JAVA_HOME PATH
[root@jenkins local]# # source /etc/profile.d/java.sh
```

```
[root@jenkins local]# java -version
java version "1.8.0_211"
Java(TM) SE Runtime Environment (build 1.8.0_211-b12)
Java HotSpot(TM) 64-Bit Server VM (build 25.211-b12, mixed mode)
[root@jenkins local]#
```

解压 apache 这个压缩包

把 war 包放到/usr/local/tomcat7/webapps 目录，重启 tomcat，就能够自动把 jenkins.war 包解压变成一个 jenkins 目录。

2. 配置 tomcat

```
[root@jenkins local]# tar xf apache-tomcat-7.0.94.tar.gz -C /usr/local // 解压 tomcat
压缩包
[root@jenkins local]# cd /usr/local
```

```
[root@jenkins local]# mv apache-tomcat-7.0.94/ tomcat7 // 改名
[root@jenkins local]# cp jenkins.war /usr/local/tomcat7/webapps/ // 把 jenkins.war
放在 webapps 目录下
[root@jenkins local]# /usr/local/tomcat7/bin/startup.sh // 启动 tomcat
[root@jenkins local]# netstat -tnlp // 查看 8080 端口
```

3、安装 jenkins

在 jenkins 机器中查看上述文件把密码输入到下面用于解锁 jenkins。

```
cat /root/.jenkins/secrets/initialAdminPassword
```

3. www1

1. 构建 LAMP 架构

Linux + APache + MySQL + PHP

1.Apache 服务

```
# yum install httpd -y
```

```
# systemctl start httpd
```

```
systemctl start mariadb //安装 mariadb 数据库的，默认没有密码
```

2.PHP 服务：

```
# yum install php php-mysql -y
```

3.修改 apache 配置文件，配置 php 跟 apache 联动

```
# vim /etc/httpd/conf/httpd.conf
```

```
//在指定位置添加上 index.php
```

```
#
<IfModule dir_module>
    DirectoryIndex index.html index.php
</IfModule>
```

4. # systemctl restart httpd //重启服务

测试 apache 是否能跟 php 联动

vim /var/www/html/index.php

```
[root@QF ~]# cat /var/www/html/index.php
<?php
    phpinfo();
?>
[root@QF ~]#
```

二：部署 nfs，实现数据库同步

修改配置文件

```
[root@master ~]# vim /etc/my.cnf
```

```
[mysqld]
```

```
log-bin=binlog #开启二进制日志
```

```
server-id=1 #指定服务 id
```

重新启动服务

```
[root@master ~]# systemctl restart mysqld
```

查看日志：

```
MariaDB [(none)]> show master status;
+-----+-----+-----+-----+
| File           | Position | Binlog_Do_DB | Binlog_Ignore_DB |
+-----+-----+-----+-----+
| binlog.000003  | 402     |               |                   |
+-----+-----+-----+-----+
```

实现数据库同步：

```
MariaDB [(none)]> change master to
```

```
master_host='124.71.168.100',
```

```
master_port=3306,master_user='repluser',
```

```
master_password='Qf..2021',
```

```
master_log_file='binlog.000003',
```

```

MariaDB [(none)]> create database ghj;
Query OK, 1 row affected (0.00 sec)

MariaDB [(none)]>

```

三：构建 Zabbix 被监控端：

rpm -Uvh

https://repo.zabbix.com/zabbix/5.0/rhel/7/x86_64/zabbix-release-5.0-1.el7.noarch.rpm

//会安装出一个 zabbix.repo

yum clean all

yum install zabbix-agent -y

vim /etc/zabbix/zabbix_agent.conf

Server=121.40.30.90 //改为监控端的 IP

ServerActive=121.40.30.90 //改为监控端的 IP

Hostname=zabbix server //修改主机名，web1

四.测试结果

问题	时间	信息	主机	问题·严重性	持续时间	确认	动作
	00:08:45		www1	HTTP service is down on www1	25s	不	
	今天						
	2021-09-17 20:59:32		web1	HTTP service is down on web1	3h 9m 38s	不	

4. www2

2. 构建 LAMP 架构

Linux + APache + MySQL + PHP

环境：Linux 发行版 centos 7.6 64 位

Apache 服务

```
# yum install httpd -y
# systemctl start httpd
systemctl start mariadb //安装 mariadb 数据库的，默认没有密码
```

PHP 服务：

```
# yum install php php-mysql -y
```

修改 apache 配置文件，配置 php 跟 apache 联动

```
# vim /etc/httpd/conf/httpd.conf
```

//在指定位置添加上 index.php

```
#
<IfModule dir_module>
    DirectoryIndex index.html index.php
</IfModule>
```

```
# systemctl restart httpd //改了配置文件一定记得重启服务
```

测试 apache 是否能跟 php 联动

```
# vim /var/www/html/index.php
```

```
[root@QF ~]# cat /var/www/html/index.php
<?php
    phpinfo();
?>
[root@QF ~]#

2、Nginx 虚拟主机配置

1、配置子文件夹目录

```

```

在 http 块内添加以下内容

```
include /usr/local/nginx/conf.d/*.conf;
```

```
#mkdir /usr/local/nginx/conf.d/
```

2、配置创建两台虚拟主机--配置文件

```
# vim /usr/local/nginx/conf.d/www1.conf
```

```
server{
    listen 80;
    server_name www1.com;
    location / {
        index index.php index.html;
        proxy_pass http://124.70.191.42/upload/home/;
    }
}
```

vim /usr/local/nginx/conf.d/www1.conf

```
server{
    listen 80;
    server_name www2.com;
    location / {
        index index.php index.html;
        proxy_pass http://124.71.168.100/upload/home/;
    }
}
```

3、配置负载均衡

vim /usr/local/nginx/conf.d/qqfarm.conf

```
upstream webs{
    server 124.70.191.42;
    server 124.71.168.100;
}

server{
    listen 80 default;
    server_name qqfarm.com;
    location / {
        index index.php index.html;
        proxy_pass http://webs/upload/home/;
